Dragon is a fully autonomous spacecraft designed to transport cargo and ultimately people to and from orbit. Falcon 9 delivers payloads to space aboard the Dragon spacecraft or inside a composite fairing. [Dragon](#) carries cargo in the spacecraft's pressurized capsule and unpressurized trunk, which can also accommodate secondary payloads. In the future, Dragon will carry astronauts in the pressurized capsule as well. Dragon's trunk supports the Dragon spacecraft during ascent to space, houses the solar panels and contains a cargo carrier designed to hold unpressurized cargo. The payload fairing is for the delivery of satellites to destinations in low Earth orbit (LEO), geosynchronous transfer orbit (GTO) and beyond. The Falcon 9 is launching in 10 days, [see the Launch Manifest](#).
